	Background: This gene encodes a member of the cytochrome P450 superfamily of enzymes.	
	The cytochrome P450 proteins are monooxygenases which catalyze many reactions involved	
	in drug metabolism and synthesis of cholesterol, steroids and other lipids. This protein localizes	
	to the endoplasmic reticulum and hydroxylates steroids at the 21 position. Its activity is	
	required for the synthesis of steroid hormones including cortisol and aldosterone. Mutations in	
	this gene cause congenital adrenal hyperplasia. A related pseudogene is located near this gene,	
	gene conversion events involving the functional gene and the pseudogene are thought to	
	account for many cases of steroid 21-hydroxylase deficiency. Two transcript variants encoding	
	different isoforms have been found for this gene. [provided by RefSeq].
