## **Target Details**

Target Type:	Viral Protein		
Background:	Synonyms: Tumor necrosis factor receptor superfamily member 14, HVEML, ATAR, CD258,		
	CD258 antigen, CD40 like protein precursor, Herpesvirus entry mediator A, Herpesvirus entry		
	mediator, Herpesvirus entry mediator ligand, HVEA, HVEM, HVEM L, HVEML, LIGHT, LIGHTR,		
	TNFSF 14, TR2, Tumor necrosis factor receptor like gene2, TNR14_HUMAN.		
	Background: TNFRSF14 is a type I membrane protein belonging to the TNF receptor		
	superfamily. This receptor mediates herpes virus entry into cells during infection. TNFRSF14 is		
	able to inhibit the proliferation, activation, and cytokine production of T cells. It has an		
	extracellular domain containing several cysteine-rich repeats and a short cytoplasmic region		
	containing a TRAF (TNF receptor-associated factor) interaction domain. The extracellular		
	domain of TNFRSF14 interacts with the herpes simplex virus envelope glycoprotein D.		
	TNFRSF14 binds two cellular ligands: lymphotoxin alpha and LIGHT. LIGHT is a		
	transmembrane protein expressed and shed from the surface of activated T cells, exhibits		
	inducible expression, and competes with HSV glycoprotein D for HVEM, a receptor expressed		
	by T lymphocytes. The LIGHT:TNFRSF14 interaction controls immune response functions by		
	cell death induction as well as cell activation. TNFRSF14 is expressed by peripheral blood T		
	cells, B cells, monocytes and in various tissues enriched in lymphoid cells.
