	Tripartite mot containing protein 63, Ubiquitin ligase TRIM63.
	Background: This gene encodes a member of the RING zinc finger protein family found in
	striated muscle and iris. The product of this gene is localized to the Z-line and M-line lattices of
	myofibrils, where titin's N-terminal and C-terminal regions respectively bind to the sarcomere. I
	vitro binding studies have shown that this protein also binds directly to titin near the region of
	titin containing kinase activity. Another member of this protein family binds to microtubules.
	Since these family members can form heterodimers, this suggests that these proteins may
	serve as a link between titin kinase and microtubule-dependent signal pathways in muscle.
