Target Details

Background:	Background: Transcription elongation factor S-II protein 2 (TFIIS) is necessary for efficient RNA polymerase II transcription elongation past template-encoded arresting sites. The arresting sites in DNA have the property of trapping a certain fraction of elongating RNA polymerases that pass through, resulting in locked ternary complexes. Cleavage of the nascent transcript by S-II allows the resumption of elongation from the new 3'-terminus [taken from the Universal Protein Resource (UniProt) Q15560].
