	the cause of xeroderma pigmentosum A (XP-A), an autosomal recessive disease that is mainly
	characterized by a susceptibility to UV-induced skin cancer and in some cases neurological
	abnormalities. XPA is one of seven XP complementation groups that have been identified. The
	XP complementation groups represent genes critical to the nucleotide excision repair (NER)
	pathway. XPA is thought to function in the recognition of DNA damage and as a processivity
	factor for XPF and XPG.
