chromatin), and BAFs (BRG1-associated factors), have been identified as components of the
mammalian SWI/SNF-like chromatin-remodeling protein complexes. These multi-protein
complexes are proposed to function as ATP-driven motors that translocate along DNA and
destabilize nucleosomal structures to facilitate transcription factor binding. SMARCD1/BAF60a
is subunit of the SWI/SNF complex that has been identified as a factor that interacts with
nuclear receptors such as the vitamin D receptor and glucocorticoid receptor and a subset of
Fos/Jun dimers. SMARCD1 has also been shown to interact with p53 and is suggested to be
involved in the tumor suppressor activity of p53. From these findings it has been concluded
that SMARCD1 functions as a direct link between transcription factors and SWI/SNF
remodeling activity to regulate transcription.
