Target Details

	complex. Coatomer is a cytosolic protein complex that binds to dilysine motifs and reversibly
	associates with Golgi non-clathrin-coated vesicles. It is required for budding from Golgi
	membranes, and is essential for the retrograde Golgi-to-ER transport of dilysine-tagged
	proteins. Coatomer complex consists of at least the alpha, beta, beta', gamma, delta, epsilon
	and zeta subunits. Alternatively spliced transcript variants encoding different isoforms have
	been identified [taken from the Universal Protein Resource (UniProt) 014579].
