PSMD1 (PSMD1 Products)

Target Details

Background:	Background: PSMD1 [proteasome (prosome, macropain) 26S subunit, non-ATPase, 1] is a	
	subunit of the 26 S proteasome. The 26S proteasome is a multicatalytic proteinase complex	
	with a highly ordered structure composed of 2 complexes, a 20S core and a 19S regulator. The	
	20S core is composed of 4 rings of 28 non-identical subunits, 2 rings are composed of 7 alpha	
	subunits and 2 rings are composed of 7 beta subunits. The 19S regulator is composed of a	
	base, which contains 6 ATPase subunits and 2 non-ATPase subunits, and a lid, which contains	
	up to 10 non-ATPase subunits. Proteasomes are distributed throughout eukaryotic cells at a	
	high concentration and cleave peptides in an ATP/ubiquitin-dependent process in a non-	
	lysosomal pathway. An essential function of a modified proteasome, the immunoproteasome,	
	is the processing of class I MHC peptides. PSMD1 is the largest non-ATPase subunit of the 19S	
	regulator lid, which is responsible for substrate recognition and binding [taken from NCBI Entrez	
	Gene (Gene ID: 5707)].	
Gene ID:	5707	
NCBI Accession:	NP_002798	
UniProt:	Q99460	
Pathways:	Mitotic G1-G1/S Phases, DNA Replication, Synthesis of DNA, Ubiquitin Proteasome Pathway
