Target Details		
Target:	DFFA	
Alternative Name:	DNA fragmentation factor subunit alpha (DFFA Products)	
Background:	DNA fragmentation factor subunit alpha , DFF-45 , DFF1 , ICAD,Apoptosis is a cell death	

process that removes toxic and/or useless	cells during mammalian development. The
apoptotic process is accompanied by shrink	kage and fragmentation of the cells and nuclei and
degradation of the chromosomal DNA into	nucleosomal units. DNA fragmentation factor (DFF)
is a heterodimeric protein of 40-kD (DFFB) a	and 45-kD (DFFA) subunits. DFFA is the substrate for
caspase-3 and triggers DNA fragmentation	during apoptosis. DFF becomes activated when
DFFA is cleaved by caspase-3. The cleaved	fragments of DFFA dissociate from DFFB, the
active component of DFF. DFFB has been for	ound to trigger both DNA fragmentation and
chromatin condensation during apoptosis.	Two alternatively spliced transcript variants
encoding distinct isoforms have been found	for this gene. [provided by RefSeq, Jul 2008]
