created as a result of an ancient gene duplication event that led to generation of homologous C and N-terminal domains each of which binds 1 ion of ferric iron. The function of this encoded protein is to transport iron from the intestine, reticuloendothelial system, and liver parenchymal cells to all proliferating cells in the body. In addition to its function in iron transport, this protein may also have a physiologic role as granulocyte/pollen-binding protein (GPBP) involved in the removal of certain organic matter/allergens from serum.
