Target Details

Mitochondrial ribosomes (mitoribosomes) consist of a small 28S subunit and a large 39S
subunit. They have an estimated 75 % protein to rRNA composition compared to prokaryotic
ribosomes, where this ratio is reversed. Another difference between mammalian
mitoribosomes and prokaryotic ribosomes is that the latter contain a 5S rRNA. Among different
species, the proteins comprising the mitoribosome differ greatly in sequence, and sometimes in
biochemical properties, which prevents easy recognition by sequence homology. This gene
encodes a 28S subunit protein that may be a functional partner of the death associated protein
3 (DAP3). [provided by RefSeq]
