	mitochondrion. Mitochondrial ribosomes (mitoribosomes) consist of a small 28S subunit and a
	large 39S subunit. They have an estimated 75 % protein to rRNA composition compared to
	prokaryotic ribosomes, where this ratio is reversed. Another difference between mammalian
	mitoribosomes and prokaryotic ribosomes is that the latter contain a 5S rRNA. Among different
	species, the proteins comprising the mitoribosome differ greatly in sequence, and sometimes in
	biochemical properties, which prevents easy recognition by sequence homology. This gene
	encodes a 28S subunit protein. A pseudogene corresponding to this gene is found on
	chromosome 7p. [provided by RefSeq]
