## Target Details

Target:	B4GALT4
Alternative Name:	beta-1,4-galactosyltransferase 4 (B4GALT4 Products)
Background:	Beta-1,4-galactosyltransferase 4 , B4Gal-T4 , beta4Gal-T4,This gene is one of seven beta-1,4- galactosyltransferase (beta4GalT) genes. They encode type II membrane-bound glycoproteins
	that appear to have exclusive specificity for the donor substrate UDP-galactose, all transfer

biosynthesis. Two alternatively spliced transcript variants have been found for this gene.
beta4GaIT7. The enzyme encoded by this gene appears to mainly play a role in glycolipid
beta4GalT1 and beta4GalT2, beta4GalT3 and beta4GalT4, beta4GalT5 and beta4GalT6, and
a transmembrane anchor. By sequence similarity, the beta4GalTs form four groups:
that directs the protein to the Golgi apparatus and which then remains uncleaved to function as
structures. As type II membrane proteins, they have an N-terminal hydrophobic signal sequence
has a distinct function in the biosynthesis of different glycoconjugates and saccharide
galactose in a beta1,4 linkage to similar acceptor sugars: GlcNAc, Glc, and Xyl. Each beta4GalT
