protocadherin alpha gene cluster, one of three related gene clusters tandemly linked on
chromosome five that demonstrate an unusual genomic organization similar to that of B-cell
and T-cell receptor gene clusters. The alpha gene cluster is composed of 15 cadherin
superfamily genes related to the mouse CNR genes and consists of 13 highly similar and 2
more distantly related coding sequences. The tandem array of 15 N-terminal exons, or variable
exons, are followed by downstream C-terminal exons, or constant exons, which are shared by
all genes in the cluster. The large, uninterrupted N-terminal exons each encode six cadherin
ectodomains while the C-terminal exons encode the cytoplasmic domain. These neural
cadherin-like cell adhesion proteins are integral plasma membrane proteins that most likely
play a critical role in the establishment and function of specific cell-cell connections in the brain.
Alternative splicing has been observed and additional variants have been suggested but their
full-length nature has yet to be determined. [provided by RefSeq]
