Background:	Synonyms: Interleukin-5 receptor alpha, CD125 antigen, CDw125, HSIL5R3, IL5R, IL-5R,	
	Interleukin 5 Receptor alpha, Interleukin 5 receptor subunit alpha, interleukin 5 receptor type 3,	
	MGC26560, IL5RA, IL-5R alpha, IL5RA_HUMAN.	
	Background: The protein encoded by this gene is an interleukin 5 specific subunit of a	
	heterodimeric cytokine receptor. The receptor is comprised of a ligand specific alpha subunit	
	and a signal transducing beta subunit shared by the receptors for interleukin 3(IL3), colony	
	stimulating factor 2 (CSF2/GM-CSF), and interleukin 5(IL5). The binding of this protein to IL5	
	depends on the beta subunit. The beta subunit is activated by the ligand binding, and is required	
	for the biological activities of IL5. This protein has been found to interact with syndecan binding	
	protein (syntenin), which is required for IL5 mediated activation of the transcription factor	
	SOX4. Six alternatively spliced transcript variants encoding three distinct isoforms have been	
	reported.
