Target Details	
Background:	Synonyms: CHNG4, Thyroid stimulating hormone beta subunit, Thyroid stimulating hormone,
	beta precursor, Thyrotropin beta subunit, TSHB.
	Background: Thyroid stimulating hormone, also known as thyrotropin, is secreted from cells in
	the anterior pituitary called thyrotrophs, finds its receptors on epithelial cells in the thyroid
	gland, and stimulates that gland to synthesize and release thyroid hormones. TSH is a
	glycoprotein hormone composed of two subunits which are non covalently bound to one
	another. The alpha subunit of TSH is also present in two other pituitary glycoprotein hormones,
	follicle stimulating hormone and luteinizing hormone, and, in primates, in the placental hormone
	chorionic gonadotropin. Each of these hormones also has a unique beta subunit, which
	provides receptor specificity. In other words, TSH is composed of alpha subunit bound to the
	TSH beta subunit, and TSH associates only with its own receptor. Free alpha and beta subunits
	have essentially no biological activity.
