	levels are reduced in the overweight and obese. ESM1 is mainly expressed in the endothelial
	cells in human lung and kidney tissues. The expression of ESM1 gene is regulated by cytokines,
	suggesting that it may play a role in endothelium-dependent pathological disorders. Recently,
	ESM1 has been described as a specific biomarker of tip cells during neoangiogenesis. Its
	expression has been shown to be increase in presence of pro-angiogenic growth factors such
	as VEGF or FGF-2. In hypervascularized cancers, overexpression of endocan has been detected
	by immunohistochemistry using monoclonal antibodies against ESM1.
