| | region with a hydrophobic cleft. S100-B plays an important role in neurodevelopment, |
|---------------------|--|
| | differentiation, and brain construction. S100-B has neuroprotective effects, but at high |
| | concentrations S100-B is neurotoxic. Extracellular concentration of S100-B increases following |
| | brain damage, which easily penetrates into cerebrospinal fluid in brain damage and then into |
| | the blood. S100-B is expressed and produced by astrocytes in vertebrate brains and in the CNS, |
| | and the astrocytes are the major cells producing S100-B protein in gray matter, as well as |
| | oligodendrocytes are the predominant S100-B in protein producing cells in white matter. The |
| | major advantage of using S100-B is that elevations in serum or CSF levels provide a sensitive |
| | measure for determining CNS injury at the molecular level before gross changes develop, |
| | enabling timely delivery of crucial medical intervention before irreversible damage occurs. In |
| | addition, S100-B, which is also present in Mouse melanocytes, is a reliable marker for |
| | melanoma malignancy both in bioptic tissue and in serum. |
