| | Serine threonine protein kinase, KAPCG_HUMAN. |
|---------------------|---|
| | Background: PKA (or cAPK) is a cyclic AMP dependent protein kinase. When activated by the |
| | second messenger cAMP, PKA mediates diverse cellular mechanisms, including proliferation, |
| | ion transport, regulation of metabolism, plus gene transcription. PKA is comprised of two |
| | dimers of two subunits, R (regulatory) and C (catalytic). Two families of R subunit (RI and RII) |
| | and three C subunit isoforms (C alpha, C beta, and C gamma) have been identified each |
| | possessing distinct cAMP binding properties and resulting in different phosphorylation states. |
| | C subunit is activated through autophosphorylation and direct phosphorylation at Thr197 by |
| | PDK-1. Tissue specific expression of C gamma, indicates pressure on C gamma during |
| | evolution, acting to modulate it in a functionally specific way. Certain amino acid substitutions |
| | make C gamma a distinct member of the cAMP dependent subfamily of protein kinases, and |
| | suggest that C gamma may be distinct in its protein substrate specificity or its interaction with |
| | the different regulatory subunits. |

| | Interaction of EGFR with phospholipase C-gamma, Lipid Metabolism |
