	like family. This gene and several other Fc receptor-like gene members are clustered on the
	long arm of chromosome 1. The encoded protein is a single-pass type I membrane protein and
	contains 8 immunoglobulin-like C2-type domains. This gene is implicated in B cell development
	and lymphomagenesis. Alternatively spliced transcript variants encoding different isoforms
	have been identified. [provided by RefSeq, Sep 2010]
Molecular Weight:	predicted molecular mass of 35.0 kDa after removal of the signal peptide. The apparent
	molecular mass of FCRL5(752-834)-mFc is 35-55 kDa due to glycosylation.
