molecule is a heterodimer consisting of an alpha (DPA) and a beta (DPB) chain, both anchored
in the membrane. It plays a central role in the immune system by presenting peptides derived
from extracellular proteins. Class II molecules are expressed in antigen presenting cells (APC: B
lymphocytes, dendritic cells, macrophages). The alpha chain is approximately 33-35 kDa and its
gene contains 5 exons. Exon one encodes the leader peptide, exons 2 and 3 encode the two
extracellular domains, exon 4 encodes the transmembrane domain and the cytoplasmic tail.
Within the DP molecule both the alpha chain and the beta chain contain the polymorphisms
specifying the peptide binding specificities, resulting in up to 4 different molecules.
