Target Details			
Background:	Synonyms: MEK5, MAPKK5, Dual specificity mitogen-activated protein kinase kinase 5,		
	MAPK/ERK kinase 5, MEK 5, MAP2K5, MAP kinase kinase 5		
	Background: Serine/threonine kinase which acts as an essential component of the MAP kinase		
	signal transduction pathway. Plays an important role in the cascades of cellular responses		
	evoked by changes in the environment. Mediates signaling for determination of cell fate such		
	as differentiation and survival. Plays a crucial role in the apoptosis signal transduction pathway		
	through mitochondria-dependent caspase activation. MAP3K5/ASK1 is required for the innate		
	immune response, which is essential for host defense against a wide range of pathogens.		
	Mediates signal transduction of various stressors like oxidative stress as well as by receptor-		
	mediated inflammatory signals, such as the tumor necrosis factor (TNF) or lipopolysaccharide		
	(LPS). Once activated, acts as an upstream activator of the MKK/JNK signal transduction		
	cascade and the p38 MAPK signal transduction cascade through the phosphorylation and		
	activation of several MAP kinase kinases like MAP2K4/SEK1, MAP2K3/MKK3, MAP2K6/MKK6		
	and MAP2K7/MKK7. These MAP2Ks in turn activate p38 MAPKs and c-jun N-terminal kinases		
	(JNKs). Both p38 MAPK and JNKs control the transcription factors activator protein-1 (AP-1).
