Target Details

Background:	Synonyms: CDKN1A activated kinase 6, p21 activated protein kinase 6, p21 protein Cdc42/Rac-activated kinase 6, p21CDKN1A activated kinase 6, p21-ACTIVATED KINASE 6, p21activated kinase 6, PAK 5, PAK 6, PAK5, Serine threonine protein kinase PAK 6, Serine/threonine protein kinase PAK 6, Serine/threonine protein kinase PAK6, EC 2.7.1.37, PAK-5, PAK-6, Pak6, PAK6_HUMAN. Background: This gene encodes a protein that shares a high degree of sequence similarity with p21-activated kinase (PAK) family members. The proteins of this family are Rac/Cdc42-associated Ste20-like Ser/Thr protein kinases, characterized by a highly conserved amino-terminal Cdc42/Rac interactive binding (CRIB) domain and a carboxyl-terminal kinase domain. PAK kinases are implicated in the regulation of a number of cellular processes, including cytoskeleton rearrangement, apoptosis and the MAP kinase signaling pathway. The protein encoded by this gene was found to interact with androgen receptor (AR), which is a steroid hormone-dependent transcription factor that is important for male sexual differentiation and development. The p21-activated protein kinase 6 gene was found to be highly expressed in testis and prostate tissues and the encoded protein was shown to cotranslocate into the nucleus with AR in response to androgen.
