	(Chromaffin granule ATPase II) (P4-ATPase flippase complex alpha subunit
	ATP8A1),FUNCTION: Catalytic component of a P4-ATPase flippase complex which catalyzes
	the hydrolysis of ATP coupled to the transport of aminophospholipids from the outer to the
	inner leaflet of various membranes and ensures the maintenance of asymmetric distribution of
	phospholipids (PubMed:31416931). Phospholipid translocation seems also to be implicated in
	vesicle formation and in uptake of lipid signaling molecules. In vitro, its ATPase activity is
	selectively and stereospecifically stimulated by phosphatidylserine (PS) (PubMed:31416931).
	The flippase complex ATP8A1:TMEM30A seems to play a role in regulation of cell migration
	probably involving flippase-mediated translocation of phosphatidylethanolamine (PE) at the cell
	membrane (By similarity). Acts as aminophospholipid translocase at the cell membrane in
	neuronal cells (By similarity). {ECO:0000250 UniProtKB:P70704,
