Characteristics:	Key Benefits:
	<ul> <li>Made to order protein - from design to production - by highly experienced protein experts.</li> <li>Protein expressed in mammalien cells and purified in one-step affinity chromatography</li> <li>The optimized expression system ensures reliability for intracellular, secreted and transmembrane proteins.</li> </ul>
	State-of-the-art algorithm used for plasmid design (Gene synthesis).
	This protein is a made-to-order protein and will be made for the first time for your order. Our
	experts in the lab try to ensure that you receive soluble protein.
	If you are not interested in a full length protein, please contact us for individual protein fragments.
	The big advantage of ordering our made-to-order proteins in comparison to ordering custom
	made proteins from other companies is that there is no financial obligation in case the protein cannot be expressed or purified.

## Target Details

Target:	ERCC2
Alternative Name:	ERCC2 (ERCC2 Products)
Background:	General transcription and DNA repair factor IIH helicase subunit XPD (TFIIH subunit XPD) (EC
	3.6.4.12) (Basic transcription factor 2 80 kDa subunit) (BTF2 p80) (CXPD) (DNA excision repair
	protein ERCC-2) (DNA repair protein complementing XP-D cells) (TFIIH basal transcription
	factor complex 80 kDa subunit) (TFIIH 80 kDa subunit) (TFIIH p80) (Xeroderma pigmentosum
	group D-complementing protein),FUNCTION: ATP-dependent 5'-3' DNA helicase, component of
	the general transcription and DNA repair factor IIH (TFIIH) core complex, which is involved in
	general and transcription-coupled nucleotide excision repair (NER) of damaged DNA and, when
	complexed to CAK, in RNA transcription by RNA polymerase II. In NER, TFIIH acts by opening

	DNA around the lesion to allow the excision of the damaged oligonucleotide and its
	replacement by a new DNA fragment. The ATP-dependent helicase activity of XPD/ERCC2 is
	required for DNA opening. In transcription, TFIIH has an essential role in transcription initiation.
	When the pre-initiation complex (PIC) has been established, TFIIH is required for promoter
	opening and promoter escape. Phosphorylation of the C-terminal tail (CTD) of the largest
	subunit of RNA polymerase II by the kinase module CAK controls the initiation of transcription.
	XPD/ERCC2 acts by forming a bridge between CAK and the core-TFIIH complex. Involved in the
	regulation of vitamin-D receptor activity. As part of the mitotic spindle-associated MMXD
	complex it plays a role in chromosome segregation. Might have a role in aging process and
	could play a causative role in the generation of skin cancers. {ECO:0000269 PubMed:10024882,
