| | Background: The multiprotein exon junction complex (EJC) is deposited on mRNAs upstream | |
| | of exonexon junctions as a consequence of pre-mRNA splicing. In mammalian cells, this | |
| | complex serves as a key modulator of spliced mRNA metabolism. MLN51 is a | |
| | nucleocytoplasmic shuttling protein that is overexpressed in breast cancer. The function of | |
| | MLN51 in mammals remains elusive. Its fly homolog, named barentsz, as well as the proteins | |
| | mago nashi and tsunagi have been shown to be required for proper oskar mRNA localization to | |
| | the posterior pole of the oocyte. Magoh and Y14, the human homologs of mago nashi and | |
| | tsunagi, are core components of the exon junction complex (EJC). The EJC is assembled on | |
| | spliced mRNAs and plays important roles in post-splicing events including mRNA export, | |
| | nonsense-mediated mRNA decay, and translation. Human MLN51 is an RNA-binding protein | |
| | present in ribonucleo-protein complexes. | |
