Ba	ackground: Cadherins are calcium-dependent cell-cell adhesion molecules, and
pr	rotocadherins constitute a subfamily of nonclassic cadherins. Protocadherin beta 13 is a
m	nember of the protocadherin beta gene cluster, one of three related gene clusters tandemly
lir	nked on chromosome five. The gene clusters demonstrate an unusual genomic organization
si	imilar to that of B-cell and T-cell receptor gene clusters. The beta cluster contains 16 genes
ar	nd 3 pseudogenes, each encoding 6 extracellular cadherin domains and a cytoplasmic tail that
de	eviates from others in the cadherin superfamily. The extracellular domains interact in a
ho	omophilic manner to specify differential cell-cell connections. Unlike the alpha and gamma
cl	lusters, the transcripts from these genes are made up of only one large exon, not sharing
CC	ommon 3' exons as expected. These neural cadherin-like cell adhesion proteins are integral
pl	lasma membrane proteins. Their specific functions are unknown but they most likely play a
Cr	ritical role in the establishment and function of specific cell-cell neural connections.
