| Background: | Synonyms: A disintegrin and metalloproteinase domain 11, ADA11_HUMAN, MDC, |
| | Metalloproteinase like, disintegrin like, and cysteine rich protein. |
| | Background: ADAM11 was first described as MDC (Metalloproteinase-like disintergin-like |
| | cysteine-rich protein) from analysis of human brain libraries, in search of brain-specific proteins |
| | Two splice variants with different carboxyterminal ends were described. The message was |
| | found only in the brain in this publication. Another group identified ADAM11 in the human brain |
| | where ADAM11 was thought to be involved in cell migration and spatial patterning. ADAM11 |
| | was mapped to 17q21.3, a region of interest for breast cancer, and mutations in ADAM11 are |
| | associated with some breast cancers. Retinoic acid caused a doubling in ADAM11 message |
| | levels over 24 hours in NT2/D1 cells, a human embryonic carcinoma cell line. ADAM11 null |
| | mutant mice have deficits in spatial learning and motor coordination, although they did have |
| | normal cell migration and differentiation during development. ADAM11 is a member of the |
| | ADAMs family (A Disintegrin And Metalloproteinase), but does not contain the canonical |
| | HExxHxxxxH zinc-binding metalloproteinase catalytic site. The domain structure of the full- |
| | length ADAM11 includes a signal sequence, propeptide domain, metalloproteinase-like domain |
| | disintegrin-like domain, cys-rich domain, EGF-like domain, a spacer region, then the |
| | transmembrane domain and a short cytoplasmic domain. |
