Background:	Synonyms: ADAMTS like 2, ADAMTS like protein 2, ADAMTS-like protein 2, ADAMTSL 2,
	ADAMTSL-2, ADAMTSL2, ATL2_HUMAN.
	Background: ADAMTS (A Disintegrin And Metalloproteinase Domain with Thrombospondin type
	1 Modules) is a family of zinc-dependent proteases that are implicated in a variety of normal
	and pathological conditions, including arthritis and cancer. ADAMTS protein family members
	contain an amino-terminal propeptide domain, a metalloproteinase domain, a disintegrin-like
	domain and a carboxy-terminus that contains a varying number of Thrombospondin type 1
	(TSP-1) motifs. ADAMTS-L2 (ADAMTS-like protein 2) is a 951 amino acid secreted protein that
	is highly expressed in lung, kidney and liver. Mutations in the gene encoding ADAMTS are the
	cause of geleophysic dysplasia, an autosomal recessive disorder characterized by cardiac
	vavular anomalies, short stature, thick skin and brachydactyly. In individuals affected with
	geleophysic dysplasia, there is a significant increase in total active TGF-beta 1 and nuclear
	locations of p-SAMD2 in fibroblasts. Interestingly, ADAMTS-L2 interacts with LTBP-1, a
	glycoprotein that is part of the platelet-derived TGF-beta 1 complex.
