|                     | Background: Kallikreins are a subgroup of serine proteases having diverse physiological   |
|                     | functions. Growing evidence suggests that many kallikreins are implicated in carcinogenesis   |
|                     | and some have potential as novel cancer and other disease biomarkers. This gene is one of the   |
|                     | fifteen kallikrein subfamily members located in a cluster on chromosome 19. Expression of this  |
|                     | gene is regulated by steroid hormones and may be useful as a marker for breast cancer. An   |
|                     | additional transcript variant has been identified, but its full length sequence has not been  |
|                     | determined. [provided by RefSeq, Jul 2008].   |
