| | Background: Nucleoporin 54 (Nup54) is a protein that in humans is encoded by the NUP54 |
| | gene. The nuclear envelope creates distinct nuclear and cytoplasmic compartments in |
| | eukaryotic cells. It consists of two concentric membranes perforated by nuclear pores, large |
| | protein complexes that form aqueous channels to regulate the flow of macromolecules |
| | between the nucleus and the cytoplasm. These complexes are composed of at least 100 |
| | different polypeptide subunits, many of which belong to the nucleoporin family. This gene |
| | encodes a member of the phe-gly (FG) repeat-containing nucleoporin subset. Multiple |
| | alternatively spliced transcript variants have been found for this gene. |
