	Background: Testis-specific DNA binding protein responsible for insulator function, nuclear		
	architecture and transcriptional control, which probably acts by recruiting epigenetic chromatin		
	modifiers. Plays a key role in gene imprinting in male germline, by participating in the		
	establishment of differential methylation at the IGF2/H19 imprinted control region (ICR).		
	Directly binds the unmethylated H19 ICR and recruits the PRMT7 methyltransferase, leading to		
	methylate histone H4 'Arg-3' to form H4R3sme2. This probably leads to recruit de novo DNA		
	methyltransferases at these sites (By similarity). Seems to act as tumor suppressor. In		
	association with DNMT1 and DNMT3B, involved in activation of BAG1 gene expression by		
	binding to its promoter. Required for dimethylation of H3 lysine 4 (H3K4me2) of MYC and		
	BRCA1 promoters.
