	CPEB1_HUMAN, Cytoplasmic polyadenylation binding protein 1, Cytoplasmic polyadenylation	
	element binding protein, Cytoplasmic polyadenylation element binding protein 1, Cytoplasmic	
	polyadenylation element-binding protein 1, h-CEBP, hCPEB-1	
	Background: Sequence-specific RNA-binding protein that regulates mRNA cytoplasmic	
	polyadenylation and translation initiation during oocyte maturation, early development and at	
	postsynapse sites of neurons. Binds to the cytoplasmic polyadenylation element (CPE), an	
	uridine-rich sequence element (consensus sequence 5'-UUUUUAU-3') within the mRNA 3'-UTR.	
	In absence of phosphorylation and in association with TACC3 is also involved as a repressor of	
	translation of CPE-containing mRNA, a repression that is relieved by phosphorylation or	
	degradation (By similarity). Involved in the transport of CPE-containing mRNA to dendrites,	
	those mRNAs may be transported to dendrites in a translationally dormant form and	
	translationally activated at synapses (By similarity). Its interaction with APLP1 promotes local	
	CPE-containing mRNA polyadenylation and translation activation (By similarity). Induces the	
	assembly of stress granules in the absence of stress.
