Background: Synonyms: mNET1, ARHGEF8, GLYT2, Guanine nucleotide regulatory protein oncogene, NET1A, Neuroepithelial cell transforming gene 1, p65 Net1 proto oncogene, Rho guanine nucleotide exchange factor GEF 8, ARHG8_HUMAN.

Background: This gene is part of the family of Rho guanine nucleotide exchange factors. Members of this family activate Rho proteins by catalyzing the exchange of GDP for GTP. The protein encoded by this gene interacts with RhoA within the cell nucleus and may play a role in repairing DNA damage after ionizing radiation. Pseudogenes of this gene are located on the long arms of chromosomes 1, 7 and 18. Alternative splicing results in multiple transcript variants that encode different protein isoforms.
