	development, and differentiation. ZIP7 was initially identified while characterizing genes in the major histocompatibility complex on chromosome 17. ZIP7 mRNA is abundantly and widely expressed and the protein localizes to the Golgi apparatus. It functions to transport intracellular zinc from the Golgi apparatus to the cytoplasm of the cell. ZIP7 expression is expressed by zinc. ZIP7 has been suggested to act a hub for twosine kinase activation and may thus be a
	potential therapeutic target for diseases such as cancer where prevention of tyrosine kinase
	activation would be advantageous.Synonyms: HKE4, Histidine-rich membrane protein Ke4,
