**Background:** Synonyms: FXYD1 phospho S88, FXYD1 phospho Ser88, p-FXYD1 phospho S88, FXYD domain containing ion transport regulator 1, Phospholemman, PLM, fxyd1, PLM\_HUMAN, FXYD domain-containing ion transport regulator 1.

Background: PLM (FXYD1) is a member of a family of small membrane proteins that share a 35-amino acid signature sequence domain, beginning with the sequence PFXYD and containing 7 invariant and 6 highly conserved amino acids. FXYD2, also known as the gamma subunit of the Na,K-ATPase, regulates the properties of that enzyme. FXYD1 (phospholemman), FXYD2 (gamma), FXYD3 (MAT-8), FXYD4 (CHIF), and FXYD5 (RIC) have been shown to induce channel activity in experimental expression systems. PLM may be phosphorylated by several kinases, including protein kinase A, protein kinase C, NIMA kinase, and myotonic dystrophy kinase. It is thought to form an ion channel or regulate ion channel activity.
