Background:	Synonyms: PMK, PMKA, PMKASE, HUMPMKI, Phosphomevalonate kinase, hPMK, PMVK, PMKI
	Background: PMVK is a 192 amino acid peroxisomal enzyme belonging to the nucleoside
	monophosphate (NMP) kinase family and is expressed in heart, liver, skeletal muscle, kidney,
	and pancreas with lower expression in brain, placenta and lung. Induced by sterol, PMVK
	participates in isopentenyl diphosphate biosynthesis via the mevalonate pathway. PMVK
	catalyzes the conversion of mevalonate 5-phosphate into mevalonate 5-diphosphate in the fifth
	reaction of the cholesterol biosynthetic pathway. PMVK exists as a monomer and is encoded
	by a gene located on human chromosome 1, which houses over 3,000 genes and is the largest
	human chromosome spanning about 260 million base pairs and making up 8 $\%$ of the human
	genome.
