| | Background: TID1 is a human homolog of the Drosophila tumor suppressor lethal tumerous |
| | imaginal discs and encodes two mitochondrial matrix localized splice variants of human Tid1 |
| | designated hTid1S and hTid1L. These proteins are the conserved members of the DnaJ family |
| | of proteins which act as cochaperons for mitochondrial Hsp70. They contain a conserved |
| | tetrahedrical J domain which binds to Hsp70 chaperones and activates their ATPase activity. |
| | Expression of hTid1L increases apoptosis induced by DNA damaging agents as mitomycin C |
| | and TNF alpha. A J domain mutant of hTid1L can dominantly suppress apoptosis and in sharp |
| | contrast the J domain mutant of hTid1S increases apoptosis. Expression of hTid1S and hTid1L |
| | affects cytochrome c release from the mitochondria and caspase 3 activation, while activation |
| | of caspase 8 is unaffected. It is strongly suggested that these two splice variants exert their |
| | anti and pro apoptotic effects through discrete substrates and activities. Hence the relative |
| | abundance of these proteins or their substrates may allow the mitochondria to dampen or |
| | enhance the apoptotic signals. |
