| | Background: Tuberin, or TSC2 (Tuberous sclerosis complex), is implicated as a tumor | |
| | suppressor. It may function in vesicular transport, and may also play a role in the regulation of | |
| | cell growth arrest and in the regulation of transcription mediated by steroid receptors. | |
| | Interaction between hamartin (TSC1) and tuberin may facilitate vesicular docking. It specifically | |
| | stimulates the intrinsic GTPase activity of the Ras related protein RAP1A and RAB5, suggesting | |
| | a possible mechanism for its role in regulating cellular growth. Mutations in tuberin lead to | |
| | constitutive activation of RAP1A in tumors. At least three isoforms of Tuberin exist. | |
