	Background: This gene encodes a member of the ADAMTS (a disintegrin and metalloproteinase
	with thrombospondin motif) protein family. Members of the family share several distinct protein
	modules, including a propeptide region, a metalloproteinase domain, a disintegrin-like domain,
	and a thrombospondin type 1 (TS) motif. Individual members of this family differ in the number
	of C-terminal TS motifs, and some have unique C-terminal domains. The enzyme encoded by
	this gene is the von Willebrand Factor (vWF)-cleaving protease, which is responsible for
	cleaving at the site of Tyr842-Met843 of the vWF molecule. A deficiency of this enzyme is
	associated with thrombotic thrombocytopenic purpura. Alternative splicing of this gene
	generates multiple transcript variants encoding different isoforms. [provided by RefSeq, Nov
	2008].
