lipoxygenase, Epidermis-type lipoxygenase 3, Lipoxygenase 3, LOXE3_HUMAN.	
Background: Introduces molecular oxygen into polyunsaturated fatty acids. Exact substrate i	is
not known. Tissue specificity: Predominantly expressed in skin. Involvement in diseaseDefects	s in
ALOXE3 are a cause of non-bullous congenital ichthyosiform erythroderma (NCIE). NCIE is a	1
non-bullous ichthyosis, a skin disorder characterized by abnormal cornification of the	
epidermis. Most affected individuals are born with a tight, shiny, translucent covering called	
collodion membrane. The collodion membrane subsequently evolves into generalized scaling	g
and intense redness of the skin. Clinical features are milder than in lamellar ichthyoses and	
demonstrate a greater variability in the intensity of erythema, size and type of scales. In	
contrast to lamellar ichthyoses, scales are usually white, fine and powdery, and palms and	
soles are severely affected. Patients suffer from palmoplantar keratoderma, often with painf	ul
fissures, digital contractures, and loss of pulp volume.
