	P dehydratase, Probable methylthioribulose 1 phosphate dehydratase.
	Background: The mammalian homologues of the key cell death gene CED 4 in C. elegans has
	been identified recently from human and mouse and designated Apaf1 (for apoptosis protease
	activating factor 1). Apaf1 binds to cytochrome c (Apaf2) and caspase 9 (Apaf3), which leads to
	caspase 9 activation. Activated caspase 9 in turn cleaves and activates caspase 3 that is one of
	the key proteases, being responsible for the proteolytic cleavage of many key proteins in
	apoptosis. A new Apaf1 Interacting Protein (APIP) also known as CG129 and MMRP19, has
	been identified as a negative regulator of ischemic injury. APIP competes with Caspase 9
	binding site of Apaf1. APIP is predicted to code for a 204 amino acid. An isoform of APIP, APIP2
	encodes a 242 amino acid protein, which is an alternative splicing variant differing in its N
	terminus from APIP. APIP transcript is ubiquitously expressed in most adult tissue with high
	expression in skeletal muscle, heart, and kidney.
