	Background: This gene encodes a lipid-binding protein belonging to the apolipoprotein gene family. The protein is thought to play a role in lipid metabolism. Polymorphisms in this gene
	may influence circulating lipid levels and may be associated with coronary artery disease risk.
	This gene is present in a cluster with other related apolipoprotein genes on chromosome 19.
	Naturally occurring read-through transcription exists between this gene and the neighboring
	downstream apolipoprotein C-II (APOC2) gene.
