Background:	Synonyms: AAA, AD1, PN2, ABPP, APPI, CVAP, ABETA, PN-II, CTFgamma, Amyloid beta A4	
	protein, APP, Alzheimer disease amyloid protein, Cerebral vascular amyloid peptide, PreA4,	
	Protease nexin-II, A4	
	Background: This gene encodes a cell surface receptor and transmembrane precursor protein	
	that is cleaved by secretases to form a number of peptides. Some of these peptides are	
	secreted and can bind to the acetyltransferase complex APBB1/TIP60 to promote transcriptional activation, while others form the protein basis of the amyloid plaques found in the brains of patients with Alzheimer disease. Mutations in this gene have been implicated in autosomal dominant Alzheimer disease and cerebroarterial amyloidosis (cerebral amyloid	
		angiopathy). Multiple transcript variants encoding several different isoforms have been found
		for this gene. [provided by RefSeq, Jul 2008].
