containing 2, Ankyrin repeat and SOCS box containing protein 2, Ankyrin repeat containing
protein ASB2.ASB2_HUMAN
Background: The ankyrin repeat and SOCS box containing (ASB) protein family is comprised of
members which each contain "SOCS boxes" but differ from other families of protein in the
motifs they contain upstream of the SOCS box. SOCS boxes are carboxy terminal regions of
homology found in the suppressor of cytokine signaling family of proteins. The box region is
thought to be the point of interaction between SOCS proteins and E3 ubiquitin ligases. The
SOCS box serves to couple suppressor of cytokine signalling (SOCS) proteins and their binding
partners with the elongin B and C complex, possibly targeting them for degradation. The gene is
induced by all trans retinoic acid. In myeloid leukemia cells, the expression of this encoded
protein has been shown to induce growth inhibition and chromatin condensation. Multiple
alternatively spliced transcript variants have been described for this gene but their full length
sequences are not known.
