	Background: This gene encodes a protein that localizes to the nucleus and expression of this
	gene is induced in response to elevated levels of axin. The Wnt signalling pathway, which is
	negatively regulated by axin, is important in axis formation in early development and impaired
	regulation of this signalling pathway is often involved in tumors. A decreased level of
	expression of this gene in tumors compared to the level of expression in their corresponding
	normal tissues suggests that this gene product has a tumor suppressor function. [provided by
	RefSeq, Jul 2008].
