Background: Testis-specific DNA binding protein responsible for insulator function, nuclear		
architecture and transcriptional control, which probably acts by recruiting epigenetic chromatin		
modifiers. Plays a key role in gene imprinting in male germline, by participating in the		
establishment of differential methylation at the IGF2/H19 imprinted control region (ICR).		
Directly binds the unmethylated H19 ICR and recruits the PRMT7 methyltransferase, leading to		
methylate histone H4 'Arg-3' to form H4R3sme2. This probably leads to recruit de novo DNA		
methyltransferases at these sites (By similarity). Seems to act as tumor suppressor. In		
association with DNMT1 and DNMT3B, involved in activation of BAG1 gene expression by		
binding to its promoter. Required for dimethylation of H3 lysine 4 (H3K4me2) of MYC and		
BRCA1 promoters.
