Background:	Synonyms: FAD, FACD, FAD1, GLM3, BRCC2, FANCD, PNCA2, FANCD1, BROVCA2, Breast
	cancer type 2 susceptibility protein, Fanconi anemia group D1 protein, BRCA2
	Background: Involved in double-strand break repair and/or homologous recombination. Binds
	RAD51 and potentiates recombinational DNA repair by promoting assembly of RAD51 onto
	single-stranded DNA (ssDNA). Acts by targeting RAD51 to ssDNA over double-stranded DNA,
	enabling RAD51 to displace replication protein-A (RPA) from ssDNA and stabilizing RAD51-
	ssDNA filaments by blocking ATP hydrolysis. Part of a PALB2-scaffolded HR complex
	containing RAD51C and which is thought to play a role in DNA repair by HR. May participate in S
	phase checkpoint activation. Binds selectively to ssDNA, and to ssDNA in tailed duplexes and
	replication fork structures. May play a role in the extension step after strand invasion at
	replication-dependent DNA double-strand breaks, together with PALB2 is involved in both POLH
	localization at collapsed replication forks and DNA polymerization activity. In concert with
	NPM1, regulates centrosome duplication. Interacts with the TREX-2 complex (transcription and
	export complex 2) subunits PCID2 and DSS1, and is required to prevent R-loop-associated DNA
	damage and thus transcription-associated genomic instability. Silencing of BRCA2 promotes R-
	loop accumulation at actively transcribed genes in replicating and non-replicating cells,
	suggesting that BRCA2 mediates the control of R-loop associated genomic instability,
	independently of its known role in homologous recombination (PubMed:24896180).
