Target Details

Bac	ckground: Calpains are a family of cytosolic calcium activated cysteine proteases involved in
a va	ariety of cellular processes including apoptosis, cell division, modulation of integrin and
cyte	oskeletal interactions, and synaptic plasticity. Calpain 12 was first described in the mouse,
mo	st strongly in the skin, and maps to mouse chromosome 7. Isoforms differ in the
car	boxyterminal ends, ending with aberrant domain III and lacking domain IV. Domains in the
larç	ge subunit include the amino terminal domain I, the proteinase domain II, domain III, and the
EF	hand domain IV, making Calpain 12 most similar to calpains 1 and 2.
