| | Background: This gene encodes a member of the Ced-4 family of apoptosis proteins. Ced- |
| | family members contain a caspase recruitment domain (CARD) and are known to be key |
| | mediators of programmed cell death. The encoded protein contains a distinct N-terminal pyrin- |
| | like motif, which is possibly involved in protein-protein interactions. This protein interacts |
| | strongly with caspase 2 and weakly with caspase 9. Overexpression of this gene was |
| | demonstrated to induce apoptosis in cells. Multiple alternatively spliced transcript variants |
| | encoding distinct isoforms have been found for this gene, but the biological validity of some |
| | variants has not been determined. [provided by RefSeq, Jul 2008]. |
